

Card Platform On-Call Runbook & Escalation Roster

Document Type: engineering | Service: Card Authorization Platform | Version: 3.1 | Updated: 2026-02-15

1. Escalation Roster

Primary On-Call: Lena Vasquez -- lena.vasquez@aexp.com -- (480) 555-0166
Secondary On-Call: Omar Haddad -- omar.haddad@aexp.com -- (480) 555-0177
Engineering Manager: Krishna Madhav Reddy -- (602) 555-0143
Platform Director (escalation after 30 min SEV1): Abhishek Dixit -- (602) 555-0109

PagerDuty rotation: card-platform-primary. Escalation policy CP-ESC-2.

2. Common Alerts & First Response

ALERT authz_latency_p99 > 800ms: check the downstream risk-scoring service health dashboard; if risk-scoring is degraded, enable the cached-decision fallback flag 'authz.fallback.enabled=true'.

ALERT decline_rate_spike: compare against the merchant-category baseline; a spike isolated to one acquirer usually indicates an upstream network issue -- open a bridge with Network Operations before changing platform config.

ALERT token_vault_unreachable: this is an automatic SEV1; page the secondary immediately and notify the Engineering Manager in Section 1.

3. Recovery Procedures

Restart sequence for the authorization workers must follow: drain connections, wait for in-flight transactions to settle (max 30s), then rolling-restart no more than two pods at a time to preserve quorum. Never restart the token vault and the authorization workers simultaneously. After recovery, confirm the p99 latency returns below 400ms and post an all-clear in the incident channel. For anything exceeding 30 minutes at SEV1, escalate to the Platform Director listed in Section 1.
